Bureau of Statistic**

Statistical Yearbook 2008

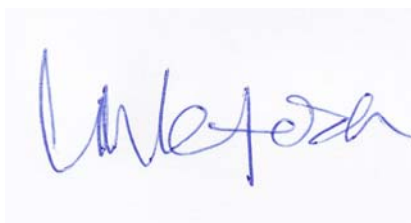

Preface

The Statistical Yearbook 2008 is the first Yearbook in many years, after the Bureau of Statistics decided to revive this publication, which was compiled and released fairly regularly until 1996 but then discontinued. The intention of the Yearbook is to put together available statistics produced by the Bureau and other institutions, thus providing a comprehensive set of statistics for Lesotho in one publication.

Statistics are presented in 15 thematic chapters, A-O. When available and appropriate, the tables contain time series of up to ten years are contained. Each chapter begins with one or two pages of comments and graphs, which are meant to highlight and explain some of the facts contained in the tables.

The intention is now to update and modify the Yearbook annually. In our quest to improve on the Yearbook and the statistics produced by the Bureau, we welcome suggestions and critique from our users.

The Bureau acknowledges the continued cooperation of government ministries, business enterprises and other private organisations that have contributed data to the Yearbook.

A handwritten signature in blue ink, appearing to read 'Liengoane Lefosa', is centered on a light blue background.

Liengoane Lefosa
Director of the Bureau of Statistics
April 2009

Table of Contents

A. Geography and Climate.....	1
B. Population.....	7
C. Tourism.....	15
D. Agriculture, Forestry and Fishing.....	19
E. Industry and Electricity	27
F. Transport and Communication	31
G. National Accounts	37

J. Money and Banking	57
K. Prices	61
L. Labour Market.....	65
M. Education.....	71
N. Health and Medical Care.....	75
O. Crime and Correctional Services.....	79

Symbols and Conventions

- Data not available
- Nil; equal to zero
- 0 Less than 0.5 but greater than zero
- 0.0 Less than 0.05 but greater than zero

More Statistics

The Bureau produces and publishes more detailed statistics on subject matter areas in this Yearbook. This is available from the Bureau's website:

www.bos.gov.ls

The Yearbook is available for download from the website as well as all the tables in Excel files.

Some basic facts (Table A.1)

Lesotho is a country in Southern Africa, located at around 29°30' south latitude and 28°30' east longitude. It is the 141st largest country in the world, with a total land area of 30,355 square kilometres. Lesotho is completely surrounded by South Africa, making it one of only three countries in the world that are enclaves within another country; the other two are San Marino and Vatican City, both located within Italy. The total length of the South African border is 909 kilometres. Lesotho's status as an enclave also means that it is landlocked and largely dependent on South Africa. The nearest major shipping port is Durban in South Africa.

The most notable geographic fact about Lesotho, apart from its status as an enclave, is that it is the only independent state in the world that lies entirely at altitude of 1,000 metres (3,300 ft) above sea level. Its lowest point is at 1,388 metres (4,600 ft), the highest lowest point of any country.

Administrative areas (Table A.2)

Lesotho is divided into 10 administrative districts, each with its own capital. The districts are further subdivided into 80 constituencies and 129 local community councils. The district towns have the same name as the district itself with three exceptions: Leribe, where the capital is Hlotse; Berea, where the capital is Teyateyaneng; and Quthing, where the capital is also known as Moyeni.

Besides the district towns, there are two more gazetted towns in Lesotho, namely Maputsoe in Leribe district and Semonkong in Maseru district.

Agro-ecological zones (Table A.3)

Lesotho comprises four distinct agro-ecological zones: Lowland, Foothill, Mountain and Senqu River Valley. These zones are characterised by significant climatic and ecological differences:

- **Lowlands:** Characterized by relatively high rainfall and allows cultivation of maize, sorghum, beans, winter wheat and vegetables. The soil is susceptible to erosion especially by wind or flowing water.
- **Foothills:** Lower rainfall compared to the lowland zone. It rises from 1800 to 2400 meters above sea level. The loose sandy topsoil is easily eroded by wind and rainwater due to over-grazing. Maize, sorghum and summer peas are growing in this zone.

- **Mountains:** Characterized by very cold winters. It rises to elevation of 3500 meters and constitutes by far the largest, and yet the least densely populated portion of the country. Livestock is commonly found in this zone. Wheat and peas are grown in this zone. Communication facilities are very poor in most of the mountain areas.
- **Senqu River Valley:** This is a steep along the Senqu River Valley, which runs from east to west across the country. The valley is characterized by a low rainfall especially in the south-western portion and by its rich soil along the banks of the Senqu River. Winter wheat and maize are grown in this valley. Much of the valley floor is cultivated while valley sides provide grazing.

Climate (Table A.4-6)

Due to its altitude, the country remains cooler throughout the year than most other regions at the same latitude. Lesotho has a temperate climate, with hot summers and cold winters. Maseru and its surrounding lowlands often reach 30°C in the summer. Winters can be cold with the lowlands getting down to -7° C and the highlands to -18° C at times. The mean summer temperature is about 25° C and the mean winter temperate about 15° C.

The yearly precipitation varies between about 600 millimetres in the lowland valleys to about 1200 millimetres in areas of the northern and eastern escarpment bordering South Africa. The annual mean precipitation for the country is in between 700 and 800 millimetres, Most of the rain falls as summer thunderstorms: 85% of the annual precipitation falls between the months of October and April. The winters – between May and September – are usually relatively dry. Snow is common between May and September; the higher peaks can experience snowfall year-round. There is much yearly variance in the amounts of rainfall, which leads to periodic droughts.

About the statistics

The first population census of Lesotho was undertaken in 1875. Subsequent censuses were carried out at irregular intervals until a programme of a decennial census was adopted in 1936. Since then, censuses have been conducted regularly in 1946, 1956, etc. with the most recent one in 2006.

The censuses prior to 1966 did not apply modern scientific methods of data collection although some improvements were introduced in the 1956 census. Earlier censuses used the assembly method or simply rough estimates of the total population, in some cases the combination of both methods.

Since independence in 1966, the government of Lesotho, through the Bureau of Statistics, has successfully conducted five modern population censuses. The latest one was carried out in April 2006.

The population censuses in Lesotho count all usual residents of the country, the *de jure* population and all persons present in the country, the *de facto* population.

The numbers from the 2006 Census presented here are still preliminary. Thus, data on the *de facto* population are not yet available

Summary of censuses (Table B.1-2)

The *de jure* population of Lesotho was about four times bigger in 2006 compared to 1911, when the *de jure* population was counted for the first time. The intercensal growth rates □ the annual average growth between two censuses □ has fluctuated as shown in Figure B.1.

Figure B.1 Intercensal annual growth rates

The generally low rates for the period 1921-1956 could be explained partly by the method of enumeration, the great depression in the 1930s and the Second World War. After 1956 the annual growth rate increased to reach 2.6% from 1976 to 1986. The declining growth rate thereafter □ only

0.1% 1996-2006 □ are due to changes in fertility, mortality and migration as well as to the HIV/AIDS pandemic.

The *de facto* population has always been significantly lower than the *de jure* population because of migrant Basotho workers in South Africa.

Population by residency (Table B.2-5)

Fifty-five per cent of the population live in the lowland zone. This has increased from about 46% in 1976, while the share of the foothill zone has decreased from 23 to 13%. The percentage living in the mountain zone has been fairly stable at about 20%. This is also the case for the Senqu River Valley zone, where the population has fluctuated between 11 and 13%.

Figure B.2 Population by agro-ecological zone 2006

Maseru is the most populous district with close to one quarter of the population as illustrated in Figure B.3. The least populous district, on the other hand, is Qacha's Nek with about four per cent of the population.

Figure B.3 Population by district 2006

Figure B.4 Population pyramids, thousands

The district of Thaba Tseka was created in 1980 by joining areas out of the following districts: Maseru, Berea, Qacha’s Nek and Mokhotlong.

The urban population in Lesotho is relatively low, close to one quarter of the population in 2006. This has increased from 17% in 1996 and 11% in 1986. See Table B.5. As urban areas are defined by legal declarations, the data are not entirely comparative from census to census.

Population by age and sex (Table B.6)

Population pyramids for the four censuses from 1976 are shown in Figure B.4. The pyramids show percentage shares for five-year cohorts of males and females; for example close to 15% of all males were below five years of age in 1976; only 11% were in this age group in 2006.

The pyramids expose significant changes in the age structure of the population, in particular since 1986. The shrinking base of the pyramid reflects the net effect of declining birth rates since the early 1990s and the rising death rates due to the AIDS pandemic. The changing age structure also suggests a trend towards ageing of the population.

Table 6 does not include the actual numbers for 2006 as these still need to be finalised. However, the shape of the pyramid will by and large be the same as presented here.

Population by detailed areas (Table B.7-8)

Table B.7 and 8 show population in the 80 constituencies (B.7) and the 129 local community councils (B.8). The constituencies vary in population from 17,122 (Malimong in the Berea district) to 37,669 (Mabote in the Maseru district).

The data for the community councils exclude population in institutions, for example prisons. Close to 8,000 persons lived in institutions when the census was taken, nearly 4,500 male and about 3,500 female.

C. Tourism

List of tables

Table C.1 Arrivals by sex and by port of entry 16
Table C.2 Arrivals by purpose of stay 16
Table C.3 Arrivals by country of residence 16
Table C.4 Arrivals by length of stay in days 17
Table C.5 Number of accommodation establishments; number of beds; bed occupancy rate 17
Table C.8 Number of available beds and bed-nights sold by district □ 2006 17

About the statistics

Tourism statistics are based on the entry forms collected at border posts by the Ministry of Home Affairs, Department of Immigration. The Lesotho Tourism Development Corporation and the Bureau of Statistics are the agencies responsible for compiling these data. Only entry forms for persons who are not citizens of Lesotho are processed. Data were not collected for a number of years. Data collection resumed in 2003 but was incomplete for 2004 and 2005. Hence, the tables include only 2006 and 2007.

Data on accommodation are collected by the Lesotho Tourism Development Corporation from accommodation establishments around the country. These data are available from 2005 on a quarterly basis. Because of non-responses, however, the data are not entirely comparable from quarter to quarter.

Tourist arrivals (Table C.1-4)

An international tourist is defined as a visitor who enters a certain country to stay for at least one day regardless of the purpose of the visit. Thus, returning residents – less than one per cent of all entries – should strictly speaking not be considered as tourists or visitors.

About 95% of all visitors enter Lesotho by road through one of the many border posts around the country, which are indicated in Figure 1.

Figure C.1 Border posts

The major border posts are Maseru Bridge and two ports to the north of Maseru, namely Maputsoe and Caledonspoort. These three border posts account for about 80 per cent of all visitors. The main port to the south is Van Rooyens gate close to Mafeteng. Sani Pass on the eastern escarpment attracts holiday makers, many of them day visitors. Note that

some of the border posts are not included in the tables. They are all fairly small in terms of entering visitors.

The number of reporting visitors decreased with more than 56 000 in 2007 compared to 2007. South African residents accounted for all of this decrease.

Following are some salient characteristics of visitors:

- About 60% are men.
- The most important purposes of the visit is either Holiday or Other (presumably visiting friends and family), together accounting for about 80%.
- 85 to 90% of the visitors are South African residents.
- About 50% of the visitors stay only for three days or less.

Accommodation (Table C.5-6)

Table C.5 shows the number of beds available, the number of bed-nights sold and the bed occupancy rate¹. The reported number of bed-nights sold was 144 254 in 2005 and 226 508 in 2006. This huge increase is due to that a number of establishments that were included in 2006 were not included in 2005. However, there have been new entrants in the industry since 2005.

The bed occupancy rate has varied between 15 and 21% with the rate being higher in the fourth quarter as can be expected.

Table C.6 shows the number of beds available and bed-nights sold by district for 2006. Maseru accounts for more than half of the bed-nights sold (54%) as illustrated in Figure C.2.

Figure C.2 Bed-nights sold 2006, percentage share

¹ Bed occupancy rate = number of bed-nights sold as a percentage of the number of beds multiplied by the number of days in a quarter.

Table L.7	Reported accidents	69
Table L.8a	Monthly minimum wages, 1997-2003 – Maloti.....	70
Table L.8b	Monthly minimum wages, 2004-2008 – Maloti.....	70

About the statistics

The Bureau of Statistics conducted a labour force survey in June 2008 of a representative sample of households. Preliminary results are presented here in Table L.1-3, which show the employment status in the week before the survey was taken. Respondents who reported that they had worked at least one hour that week are defined as currently employed. This includes also subsistence farming. All persons aged six years and above were asked about their employment status.

The other tables in this chapter are based on administrative data.

Employment and unemployment (Table L.1-2)

Table 1 and 2 show the results for persons aged 15 years and above. This is an internationally recommended age limit for the definition of the working age population.

Another term for labour force is *economically active persons*; these are either currently employed or looking for employment. The latter are said to be currently unemployed.

Figure L.1 Labour force participation and unemployment rates

The labour force participation rate is defined as the ratio of the labour force to the working age population, expressed in percentages. According to the survey, this rate was 63.5%. It was much higher for men, 72.6%, than for women, 55.3%.

The unemployment rate was 22.5%. This is the proportion of currently unemployed over the economically active population aged 15 years and above. The unemployment rate was significantly higher for women, 24.6%, than for men, 21.2%. All in all, close to 180,000 persons were unemployed.

The unemployment rate varies for the districts, from 17.5% in Qacha's Nek to 27.1% in Quthing. See figure L.3. Like the national average, the unemployment rate is higher for women than for men in all districts.

Figure L.2 Unemployment rates by district

Employment by sector (Table L.3)

Table 4 shows employment by major sectors for all persons aged fifteen years and above. Subsistence agriculture employs about 41% of all employed persons. Private households are an important source of employment with about 22% of the total. Included here are persons working in small scale household enterprises as well as domestic servants. See figure L.3.

Figure L.3 Employment by sector

Child labour (Table L.3)

As mentioned above, all persons aged six years and above were asked about their employment status. The purpose was to measure the occurrence of child labour; persons aged 6-14 years are considered children

According to the survey, about 3% of children aged 6-14 years were currently employed. About 70% of these children were engaged in subsistence farming, while the rest was

N. Health and Medical Care

List of tables

Table N.1 Reported number of health personnel	77
Table N.2 Immunisation	77
Table N.3 Reported number of deliveries by type	77
Table N.4 Place of delivery	78
Table N.5 HIV prevalence	79

About the statistics

The Ministry of Health and Social Welfare, through the Department of Health, Planning and Statistics, collects health data from all health facilities that are operated by the Government and Christian Health Association of Lesotho (CHAL). Most data are collected on a monthly or quarterly basis. Data on health infrastructure, however, are collected on a monthly or quarterly basis. There are serious delays in the processing and analysis of the reported data and also with the consistency in the reporting by various health facilities. Therefore, only a few tables are included here. Even so, some of the changes from year to year may be due to changes in reporting.

In addition to administrative data, two tables are included from the 2004 demographic and health survey providing information on birth deliveries and HIV/AIDS.

Health personnel (Table N.1)

Table N.1 shows the number of health personnel reported by government and CHAL hospitals and clinics. While the number of medical doctors seems to have been fairly stable from 2002 to 2005, the number of nurses increased substantially during the same period. The number of nursing assistants also increased but to a lesser extent. The significant increase from 2001 to 2002 is to some extent due to improvements in the reporting.

Immunisation (Table N.2)

As shown in Table N.2 the number of BCG, DPT, and Polio immunisations reported by government and CHAL hospitals and clinics increased steadily from 2001 to 2005. DT immunisations, which differ from DPT by not including whooping cough, are not reported since 2004. Immunisation against hepatitis B was introduced on a broad scale in 2003 and 2004, hence the steep increase from 2003.

Child deliveries (Table N.3-4)

Table N.3 shows that the number of deliveries reported by government and CHAL health facilities increased from a bit more than 16,000 in 2001 to close to 21,000 in 2005. This does not include deliveries in private health facilities, which are likely to be few. According to the Demographic and Health Survey 2004 (Table N.4), 52.4% of all deliveries took place in health facilities. Out of the total number of deliveries, only 1.7% were carried out in private facilities. The proportion of deliveries taking place in health facilities:

- increases with the level of the mother's education;
- increases with the wealth of the mother;
- increases with the number of antenatal care visits;
- is much higher in urban than in rural areas;
- decreases with the mother's age at birth; and
- decreases with the number of children the mother has.

Furthermore, the proportion of deliveries in health facilities was between 50 and 55% in all districts except Maseru, where it was just above 60% and Mokhotlong and Thaba Tseka, where it was a between 37 and 40%. This tallies with the low percentage in the mountain zone, about 33%.

HIV/AIDS (Table N.4)

The proportion of HIV-positive people was 23.5% according to the Demographic and Health Survey 2004. It is higher for women, 26.4%, than for men, 19.3%

Figure N.1 HIV prevalence by urban/rural and sex

The proportion of HIV-positive persons is higher in urban areas compared to rural areas for both women and men,

Figure N.2 HIV prevalence by employment and sex

The proportion of HIV-positive persons is higher for those who are currently working compared to those who are not working.

About the statistics

The statistics in this chapter are, with one exception (Table O.5), based on administrative data collected by the Department of Police (crime) and the Department of Correctional Services. Thus, the occurrence of crime reflects the crimes that have been reported to the Police. The data on personal safety, however, are from the Household Budget Survey that was conducted in 2003 and gives a perspective on crime from the point of view of the households.

Reported cases of crime (Table O.1-4)

Reported crimes are categorised by the police in three major groups: serious, common and other; the sub-categories are clear from Table O.1. Cases of serious crimes have fluctuated between about 13000 and 17500 per annum from 1997 to 2006. There is, however, an upward trend as illustrated in Figure O.1

Figure O.1 Cases of serious crime, 1997-2006

The two most frequently reported kinds of serious crimes are house breaking and stock theft accounting for 31 and 25% respectively in 2006.

About one third of the serious cases of crime are reported in the Maseru district (Table O.2 and Figure O.2). The cases per district broadly follow the size of the population. However, the reported cases per 1000 persons are twelve for Maseru, higher than for any other district.

Reported cases of traffic offenses have dropped sharply from 2002 (close to 50000) to 2006 (close to 14000). This mainly reflects changing routines of the police.

Figure O.2 Cases of serious crime by district, 2006

Personal safety (Table O.5)

The 2003 Household Budget Survey included a Living Condition Index (LCI) module, which was administered to persons aged fifteen years and above. Individuals were requested to rate each question from one to ten, based on their level of satisfaction for the item being considered; with one, meaning not satisfied at all and ten, meaning fully satisfied.

One of the LCI-modules dealt with personal safety. Table O.5 shows that, in general, household members perceive personal safety categories to be satisfactory with a national average of 5.08. The average score varies positively with the income quintile, i.e. higher incomes means a higher average rating of personal safety.

Correctional services (Table O.6-8)

The data on correctional services do not seem to be internally consistent and should be treated with care.

The prison population has been between 2500 and 3500 for the years 1998-2005. It increased in 2006 and was close to 5000 at the end of the year. Women make up less than 5% of the prison population.

As can be expected, the majority of persons received at prisons have committed crime against person (45-50%) or property (about 40%).

Most persons received at prisons have no or only primary education, between 70 and 80% since 1998. That is roughly the same as the share of the total population with no education or only primary education.
